

**DOMAIN WINTER WINNING CAMP**

**Student Name:** RAJ SATYAM

**UID:** 22BCS15256

**Branch:** BE-CSE

**Section/Group:** 620-A

**Semester:** 5th

**of Performance:** 27/12/24

**1. Write a program to detect a cycle in the undirected graph**

```
#include <iostream> #include
<iostream>
using namespace std;

const int MAX_NODES = 100; int
adj[MAX_NODES][MAX_NODES] = {0};
bool visited[MAX_NODES];

bool dfsCycleUndirected(int node, int parent, int n) {
    visited[node] = true;
    for (int neighbor = 1; neighbor <= n; ++neighbor) {
        if (adj[node][neighbor]) {
            if (!visited[neighbor]) {
                if (dfsCycleUndirected(neighbor, node, n)) {
                    return true;
                }
            } else if (neighbor != parent) {
                return true;
            }
        }
    }
    return false;
}

int main() {
    int n, edges;
    cout << "Enter the number of nodes and edges: ";
    cin >> n >> edges;

    cout << "Enter the edges (node1 node2):";
    for (int i = 0; i < edges; ++i) {
        int u, v;
        cin >> u >> v;
        adj[u][v] = adj[v][u] = 1;
    }
}
```

```
for (int i = 1; i <= n; ++i) {
    visited[i] = false;
}
bool hasCycle = false;
for (int i = 1; i <= n; ++i) {
    if (!visited[i]) {
        if (dfsCycleUndirected(i, -1, n)) {
            hasCycle = true;
            break;
        }
    }
}
if (hasCycle) {
    cout << "Cycle detected in the undirected graph." << endl;
} else {
    cout << "No cycle detected in the undirected graph." << endl;
}

return 0; }
```

## Output

Clear

```
Enter the number of nodes and edges: 3 1
Enter the edges (node1 node2): 1 2
No cycle detected in the undirected graph.
```

```
=== Code Execution Successful ===
```

## 2. Write a program to detect a cycle in the directed graph

```
#include <iostream>
using namespace std;
```

```
const int MAX_NODES = 100; int
adj[MAX_NODES][MAX_NODES] = {0};
bool visited[MAX_NODES];
bool recStack[MAX_NODES]; // To track nodes in the current recursion stack
```

```
bool dfsCycleDirected(int node, int n) {
    visited[node] = true;
    recStack[node] = true;

    for (int neighbor = 1; neighbor <= n; ++neighbor) {
        if (adj[node][neighbor]) {
            if (!visited[neighbor]) {
                if (dfsCycleDirected(neighbor, n)) {
                    return true;
                }
            }
        }
    }
    recStack[node] = false;
    return false;
}
```

```

    }
    } else if (recStack[neighbor]) {
        return true;
    }
}
}
recStack[node] = false; // Remove the node from recursion stack
return false;
} int main() {
    int n, edges;
    cout << "Enter the number of nodes and edges: " << endl;
    cin >> n >> edges;

    cout << "Enter the edges (node1 node2):" << endl;
    for (int i = 0; i < edges; ++i) {
        int u, v;
        cin >> u >> v;
        adj[u][v] = 1; // Directed edge from u to v
    }
    for (int i = 1; i <= n; ++i) {
        visited[i] = false;    recStack[i]
        = false;
    }
    bool hasCycle = false;
    for (int i = 1; i <= n; ++i) {
        if (!visited[i]) {
            if (dfsCycleDirected(i, n)) {
                hasCycle = true;
                break;
            }
        }
    }
    if
    (hasCycle) {
        cout << "Cycle detected in the directed graph." << endl;
    } else {
        cout << "No cycle detected in the directed graph." << endl;
    }
    return 0; }

```

Output

Clear

```

Enter the number of nodes and edges: 4 3
Enter the edges (node1 node2): 1 2
2 3
3 4
No cycle detected in the directed graph.

=== Code Execution Successful ===

```

**3. Given the root of a complete binary tree, return the number of nodes in tree**

```
#include <iostream>
#include <cmath> using
namespace std;

struct TreeNode {
    int val;
    TreeNode* left;
    TreeNode* right;
    TreeNode(int value) : val(value), left(nullptr), right(nullptr) {} };

int getHeight(TreeNode* root) {
    int height = 0;
    while (root) {
        height++;    root =
        root->left;
    }
    return height;
}

int countNodes(TreeNode* root) {
    if (!root) return 0;    int leftHeight =
    getHeight(root->left);
    int rightHeight = getHeight(root->right);

    if (leftHeight == rightHeight) {
        return (1 << leftHeight) + countNodes(root->right);
    } else {
        return (1 << rightHeight) + countNodes(root->left);
    }
}

TreeNode* insertLevelOrder(int arr[], int n, int i) {
    if (i >= n) return nullptr;
    TreeNode* root = new TreeNode(arr[i]);    root-
    >left = insertLevelOrder(arr, n, 2 * i + 1);    root-
    >right = insertLevelOrder(arr, n, 2 * i + 2);    return
    root;
}

int main() {
    int n;
    cout << "Enter the number of nodes in the tree: ";
    cin >> n;    int arr[n];
    cout << "Enter the nodes in level order (use -1 for null): ";
    for (int i = 0; i < n; ++i) {
        cin >> arr[i];
    }
    TreeNode* root = insertLevelOrder(arr, n, 0);
```

```
cout << "Number of nodes in the complete binary tree: " << countNodes(root) << endl;
```

```
return 0; }
```

Output

Clear

```
Enter the number of nodes in the tree: 4
Enter the nodes in level order (use -1 for null): 1 2 3 4
Number of nodes in the complete binary tree: 4

=== Code Execution Successful ===
```

#### 4. Given the root of a binary tree, return the preorder of the nodes values

```
#include <iostream> #include
```

```
<vector>
```

```
using namespace std;
```

```
struct TreeNode {
```

```
    int val;
```

```
    TreeNode* left;
```

```
    TreeNode* right;
```

```
    TreeNode(int value) : val(value), left(nullptr), right(nullptr) {} };
```

```
void preorderTraversal(TreeNode* root, vector<int>& result) {
```

```
    if (!root) return;    result.push_back(root->val);
```

```
    preorderTraversal(root->left, result);    preorderTraversal(root->right, result);
```

```
}
```

```
TreeNode* insertLevelOrder(int arr[], int n, int i) {
```

```
    if (i >= n || arr[i] == -1) return nullptr;
```

```
    TreeNode* root = new TreeNode(arr[i]);    root->left = insertLevelOrder(arr, n, 2 * i + 1);    root->right = insertLevelOrder(arr, n, 2 * i + 2);    return root;
```

```
} int main()
```

```
{    int n;
```

```
    cout << "Enter the number of nodes in the tree: ";
```

```
    cin >> n;
```

```
    int arr[n];
```

```
    cout << "Enter the nodes in level order (use -1 for null): ";
```

```
    for (int i = 0; i < n; ++i) {
```

```
        cin >> arr[i];
```

```
    }
```

```
    TreeNode* root = insertLevelOrder(arr, n, 0);
```

```
vector<int> result;
preorderTraversal(root, result);

cout << "Preorder traversal: ";
for (int val : result) {
cout << val << " ";
}
cout << endl;

return 0; }
```

Output

Clear

```
Enter the number of nodes in the tree: 4
Enter the nodes in level order (use -1 for null): 1 2 3 4
Preorder traversal: 1 2 4 3

=== Code Execution Successful ===
```

**5. Given the root of a binary tree, you need to find the sum of all the node values in the binary tree.**

```
#include <iostream> #include
<sstream>
using namespace std;

struct TreeNode {
    int val;
    TreeNode* left;
    TreeNode* right;
    TreeNode(int x) : val(x), left(nullptr), right(nullptr) {} };
TreeNode* buildTree(const string& input, int& index) {
    if (index >= input.size() || input[index] == ',') {
        index++;
        return nullptr;
    }
    int num
    = 0;
    while (index < input.size() && input[index] != ',' && input[index] != ')') {
        num = num * 10 + (input[index] - '0');
        index++;
    }
    TreeNode* node = new TreeNode(num); node-
    >left = buildTree(input, index);
    node->right = buildTree(input, index);
    return node;
}

int sumOfNodes(TreeNode* root) {
    if (!root) return 0;
    return root->val + sumOfNodes(root->left) + sumOfNodes(root->right);
}
```

```
} int main() {  
string input;  
    cout << "Enter the tree nodes (comma separated): ";  
getline(cin, input);    int index = 0;  
    TreeNode* root = buildTree(input, index);  
int sum = sumOfNodes(root);  
    cout << "Sum of all nodes: " << sum << endl;  
return 0; }
```

## Output

Clear

```
Enter the tree nodes (comma separated): 1,2,3,4,5  
Sum of all nodes: 15
```

```
=== Code Execution Successful ===
```

## 6. Implement DFS for a binary tree

```
#include <iostream>  
using namespace std;
```

```
struct TreeNode {  
    int val;  
    TreeNode* left;  
    TreeNode* right;  
    TreeNode(int value) : val(value), left(nullptr), right(nullptr) {} };
```

```
void dfs(TreeNode* root) {  
    if (!root) return;    cout <<  
    root->val << " ";  
    dfs(root->left);    dfs(root->  
    >right);  
}
```

```
TreeNode* insertLevelOrder(int arr[], int n, int i) {  
    if (i >= n || arr[i] == -1) return nullptr;  
    TreeNode* root = new TreeNode(arr[i]); root->  
    >left = insertLevelOrder(arr, n, 2 * i + 1);  
    root->right = insertLevelOrder(arr, n, 2 * i + 2);  
    return root;  
}
```

```
int main() {  
    int n;  
    cout << "Enter the number of nodes in the tree:";  
    cin >> n;    int arr[n];
```

```
cout << "Enter the nodes in level order (use -1 for null):";  
for (int i = 0; i < n; ++i) {      cin >> arr[i];  
}
```

```
TreeNode* root = insertLevelOrder(arr, n, 0);  
cout << "DFS traversal: ";  
dfs(root);  
cout << endl;  
return 0; }
```

**Output** Clear

```
Enter the number of nodes in the tree:3  
Enter the nodes in level order (use -1 for null):1 2 -1  
DFS traversal: 1 2  
  
=== Code Execution Successful ===
```

7. Given a Binary Tree, the task is to count leaves of the tree if both left and right child nodes of it are NULL.

```
#include <iostream> #include  
<sstream>  
using namespace std;  
  
struct TreeNode {  
    int val;  
    TreeNode* left;  
    TreeNode* right;  
    TreeNode(int x) : val(x), left(nullptr), right(nullptr) {} };  
TreeNode* buildTree(const string& nodes) {  
    if (nodes.empty()) {  
return nullptr;  
    }  
    istringstream iss(nodes);  
    string token; iss >>  
    token;  
    int val = atoi(token.c_str());  
    TreeNode* root = new TreeNode(val);  
  
    TreeNode* current = root;  
    while (iss >> token) {  
        int val = atoi(token.c_str());  
        TreeNode* newNode = new TreeNode(val);  
  
        if (!current->left) {  
current->left = newNode;  
        } else {
```

```
        current->right = newNode;
current = root;
        while (current->left && current->right) {
            current = current->left;
        }
    } }
return root;
}

int countLeaves(TreeNode* root) {
    if (!root) {
return 0;
    }
    if (!root->left && !root->right) {
        return 1;
    }
    return countLeaves(root->left) + countLeaves(root->right);
}

void deleteTree(TreeNode* root) {
    if (!root) {        return;
    }
    deleteTree(root->left);
    deleteTree(root->right);    delete
    root;
}

int main() {
    cout << "Enter tree nodes separated by spaces: ";
    string input;
    getline(cin, input);

    TreeNode* root = buildTree(input);
    if (!root) {
        cout << "Invalid input." << endl;
        return 1;
    }
    int numLeaves = countLeaves(root);
    cout << "Number of leaves: " << numLeaves << endl;
    deleteTree(root);

    return 0; }
```

**Output** Clear

```
Enter tree nodes separated by spaces: 1 2 3  
Number of leaves: 2  
  
=== Code Execution Successful ===
```

## 8. Create a cyclic graph

```
#include <iostream>
using namespace std;

struct TreeNode {
    int val;
    TreeNode *left;
    TreeNode *right;
    TreeNode(int x) : val(x), left(NULL), right(NULL) {} };

class Solution { public:
    bool hasPathSum(TreeNode* root, int sum) {
        if (!root) return false;
        return dfs(root, sum);
    }

    bool dfs(TreeNode* node, int sum) {
        if (!node) return false;
        if (!node->left && !node->right && node->val == sum) return true;
        return dfs(node->left, sum - node->val) || dfs(node->right, sum - node->val);
    }
};

TreeNode* createNode(int val) {
    TreeNode* newNode = new TreeNode(val);
    return newNode;
}

void insertNode(TreeNode** root, int val) {
    if (*root == NULL) *root = createNode(val);
    else if (val < (*root)->val) {
        if ((*root)->left == NULL) (*root)->left = createNode(val);
        else insertNode(&((*root)->left), val);
    } else {
        if ((*root)->right == NULL) (*root)->right = createNode(val);
        else insertNode(&((*root)->right), val);
    }
}
```

```
void printTree(TreeNode* root) {
if (root == NULL) return;    cout
<< root->val << " ";
printTree(root->left);
printTree(root->right);
} int main() {
Solution solution;
    TreeNode* root = NULL;
    int n;
    cout << "Enter the number of nodes: ";
    cin >> n;
    for (int i = 0; i < n; i++) {
        int val;
        cout << "Enter node " << i + 1 << ": ";
        cin >> val;
        insertNode(&root, val);
    }

    cout << "Binary Tree: ";
printTree(root);
    cout << endl;

    int sum;
    cout << "Enter the sum: ";
    cin >> sum;

    bool result = solution.hasPathSum(root, sum);

    cout << "Path with sum " << sum << ": " << (result ? "Found" : "Not Found") << endl;

    return 0; }
```

```
Output
Enter the number of nodes: 2
Enter node 1: 1
Enter node 2: 2
Binary Tree: 1 2
Enter the sum: 3
Path with sum 3: Found

=== Code Execution Successful ===
```

## 9. Find the centre of the star graph

```
#include <iostream> #include
<cstring>
using namespace std;
```

```
const int MAX = 100; int
graph[MAX][MAX];
int findCenter(int n) {
    int maxDegree = 0;
    int centerNode = -1;

    for (int i = 0; i < n; ++i) {
        int degree = 0;
        for (int j = 0; j < n; ++j) {
            if (graph[i][j]) degree++;
        }
        if (degree > maxDegree) {
            maxDegree = degree;
            centerNode = i;
        }
    }
    return centerNode;
}

int main() {
    int n, m;
    cout << "Enter the number of vertices and edges: ";
    cin >> n >> m;    memset(graph, 0, sizeof(graph));
    cout << "Enter the edges (u v) for the undirected graph:\n";
    for (int i = 0; i < m; ++i) {
        int u, v;
        cin >> u >> v;
        graph[u][v] = graph[v][u] = 1;
    }
    int centerNode = findCenter(n);
    cout << "The center of the star graph is: " << centerNode << endl;

    return 0;
}
```

**Output** Clear

```
Enter the number of vertices and edges: 5 4
Enter the edges (u v) for the undirected graph:
0 1
0 2
0 3
0 4
The center of the star graph is: 0

=== Code Execution Successful ===
```

10. Write a program to find minimum spanning tree.

```
#include <iostream>
#include <climits> using
namespace std;
```

```
void primMST(int graph[100][100], int n) {
    int key[n];    bool inMST[n];    int
    parent[n];    int min_index;

    for (int i = 0; i < n; ++i) {
        key[i] = INT_MAX;
        inMST[i] = false;    parent[i]
        = -1;
    }    key[0]
    = 0;

    for (int count = 0; count < n - 1; ++count) {
        int minKey = INT_MAX;
        min_index = -1;

        for (int v = 0; v < n; ++v) {            if
        (!inMST[v] && key[v] < minKey) {
            minKey = key[v];
        }
        min_index = v;
    }
    inMST[min_index] = true;
    for (int v = 0; v < n; ++v) {
        if (graph[min_index][v] && !inMST[v] && graph[min_index][v] < key[v]) {
            key[v] = graph[min_index][v];
            parent[v] = min_index;
        }
    }
    cout << "Minimum Spanning Tree Edges:\n";
    cout << "Edge \tWeight\n";
    for (int i = 1; i < n; ++i) {
        cout << parent[i] << " - " << i << "\t" << graph[i][parent[i]] << "\n";
    }
    cout << "End of MST Output\n";
} int main()
{    int n;
    cout<<"Enter size: ";
    cin >> n;

    int graph[100][100];    for
    (int i = 0; i < n; ++i) {        for
    (int j = 0; j < n; ++j) {
        cin >> graph[i][j];
    }
}

primMST(graph, n);
```

```
return 0;
}
```

The screenshot shows a terminal window titled "Output" with a "Clear" button. The output text is as follows:

```
Enter size: 2
1 2
3 4
Minimum Spanning Tree Edges:
Edge   Weight
0 - 1   3
End of MST Output

=== Code Execution Successful ===
```

11. Write a program to count the number of connect components in an undirected graph

```
#include <iostream>
using namespace std;

void dfs(int node, int graph[100][100], bool visited[], int n) {
    visited[node] = true;
    for (int neighbor = 0; neighbor < n;
        ++neighbor) {
        if (graph[node][neighbor] &&
            !visited[neighbor]) {
            dfs(neighbor, graph, visited, n);
        }
    }
}

int countConnectedComponents(int n, int graph[100][100]) {
    bool visited[n];
    for (int i = 0; i < n; ++i) {
        visited[i] = false;
    }

    int count = 0;
    for (int i = 0; i < n; ++i) {
        if (!visited[i]) {
            ++count;
            dfs(i, graph, visited, n);
        }
    }
    return count;
}

int main() {
    int n, e;
    cout << "Enter number of vertices and edges: ";
```

```
cin >> n >> e;

int graph[100][100] = {0};
cout << "Enter edges (u v):\n";
for (int i = 0; i < e; ++i) {
    int u, v;    cin
    >> u >> v;
    graph[u][v] = 1;
    graph[v][u] = 1;
}

int result = countConnectedComponents(n, graph);
cout << "Number of connected components: " << result << endl;

return 0;
}
```

```
Output
Enter number of vertices and edges: 3 2
Enter edges (u v):
1 2
2 3
Number of connected components: 2

=== Code Execution Successful ===
```

12. Write a program to check the graph is tree or not

```
#include <iostream> using
namespace std;

void dfs(int node, int graph[100][100], bool visited[], int n) {
    visited[node] = true;
    for (int neighbor = 0; neighbor < n; ++neighbor) {
        if (graph[node][neighbor] && !visited[neighbor]) {
            dfs(neighbor, graph, visited, n);
        }
    }
}

bool isConnected(int n, int graph[100][100]) {

14. Write a program to find the diameter of a undirected graph. Use BFS and DFS

```
#include <iostream> #include
<cstring>
using namespace std;

const int MAX = 100; int
graph[MAX][MAX]; bool
visited[MAX]; int
maxDist, farthestNode;
void dfs(int node, int dist,
int n) {    visited[node] =
true;    if (dist > maxDist)
{        maxDist = dist;
farthestNode = node;
    }
    for (int i = 0; i < n; ++i) {    if
(graph[node][i] && !visited[i]) {
        dfs(i, dist + 1, n);
    }
}
```

```
    }  
  }  
}  
  
int findDiameterDFS(int n) {  
    memset(visited, false, sizeof(visited));  
    maxDist = 0;  
    dfs(0, 0, n);  
  
    memset(visited, false, sizeof(visited));  
    maxDist = 0;    dfs(farthestNode, 0, n);  
  
    return maxDist;  
}  
  
int main() {  
    int n, m;  
    cout << "Enter the number of vertices and edges: ";  
    cin >> n >> m;  
  
    memset(graph, 0, sizeof(graph));  
  
    cout << "Enter the edges (u v) for the undirected graph:\n";  
    for (int i = 0; i < m; ++i) {  
        int u, v;  
        cin >> u >> v;  
        graph[u][v] = graph[v][u] = 1;  
    }  
  
    cout << "The diameter of the graph is: " << findDiameterDFS(n) << endl;  
  
    return 0;  
}
```

# DEPARTMENT OF

# COMPUTER SCIENCE & ENGINEERING

Output

Clear

```
Enter the number of vertices and edges: 5 4
Enter the edges (u v) for the undirected graph:
1 2
3 4
5 6
7 8
The diameter of the graph is: 0
```

```
